They can be prepared by chemical synthesis or by use of recombinant DNA techniques. The peptide antagonists are used as an antiinflammatory agents in the treatment of gastrointestinal inflammation, where they bind to the 20T receptor in the intestine and yet does not physiologically modulate the opening of TJ in the intestine. Gastrointestinal inflammation conditions give rise to increased intestinal permeability and the peptide is useful for treating intestinal conditions that cause protein losing enteropathy caused by infection, e.g. Clostridium difficile infection, enterocolitis, shigellosis, viral gastroenteritis, parasite infestation, bacterial overgrowth, whipple's disease, diseases with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       mucosal erosion or ulcerations, e.g. gastritis, gastric cancer, collagenous colitis, inflammatory bowel disease, diseases marked by lymphatic obstruction, e.g. congenital intestinal lymphangiectasia, sarcoldosis lymphoma, mesenteric tuberculosis, and after surgical correction of congenital heart disease with Fontan's operation, mucosal diseases without ulceration, e.g. Menetrier's disease, coeliac disease, eosinophilic gastroenteritis, and immune diseases, e.g. systemic lupus erythematosus or food allergies, primarily to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This present sequence is that of a peptide antagonist of zonulin (Z), one of 25 such peptides (see Y79105-29) of the invention, which bind to a zonula occludens toxin (ZOT) receptor, yet do not physiologically modulate the opening of mammalian tight junctions (TJ). The peptide antagonists are based on a common motif of ZOT and human zonulins, which is believed to be critical for receptor and human zonulins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Claim 1; Page 47; 69pp;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  shigellosis, viral gastroenteritis,

It may also play a role in breast cancer, glioblastomas, and pituitary adenomas. Zneul may also be used to treat Alzheimer's disease, cancer, to repopulate blood cells after chemotherapy, to stimulate myofibroblast proliferation, stimulate or inhibit growth factors made in the placenta, in fertility and contraception, or to regenerate nerves. Claimed Zneul polypeptides (see also W88382-97), including specific domains of Zneul and epitope-bearing portions of Zneul, can be used to raise specific antibodies for use e.g. in

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This claimed polypeptide comprises amino acid residues 105-177 of C the human Zneul mature protein (see W88382), i.e. the 2 epidermal growth factor-like domains (see also W88384-85) of Zneul is a new neuro-growth factor-like protein that can be used as a growth, maintenance, or differentiation factor in the spinal cord, heart, spleen, testis, thyroid and lymph nodes. Zneul may also play a role in breast cancer, glioblastomas, and pituitary adenomas. Zneul can be used to treat Alzhelmer's disease, cancer, to repopulate blood cells after chemotherapy, to stimulate myofibroblast proliferation, stimulate or inhibit growth factors made in the placenta, in fertility and contraception, or to regenerate nerves. Claimed Zneul polypeptides (see also W88382-97), including specific domains of Zneul and epitope-bearing portions of Zneul, can be used to raise specific antibodies for use e.g. in

The sequences can be used for determining the presence of or predisposition to, or preventing or treating pathological conditions associated with an ORFX-associated disorder. The nucleic acids can be used to express ORFX proteins in gene therapy vectors. The proteins and nucleic acids may be used to treat cancers, proliferative disorders, neurodegenerative disorders, osteoarthritis, graft vs host disease, cardiovascular disease, cardiovascular disease, cardiovascular disease, systemic lupus erythematosus, severe combined immunodeficiency (SCID), AIDS, viral, bacterial or fungal infection, malaria, autoimmune disorders, asthma, allergies, applastic annemnia, burns, wounds, bone and cartilage damage, nocturnal haemoglobinuria, antiinflammatory disease; to enhance coagulation; to inhibit thrombosis; and as a contraceptive.

The ORFX CC sequences have activities such as: cytostatic; hepatotropic; vulnerary; CC antipsoriatic; antiparkinsonian; nootropic; neuroprotective; osteopathic; cradiant; thrombolytic; coagulant; vasotropic; neuroprotective; osteopathic; CC cardiant; thrombolytic; coagulant; vasotropic; antidabetic; hypotensive; cardiant; thrombolytic; coagulant; vasotropic; antidabetic; hypotensive; cradialization; antifungal; antifungal; antifungal; antifungal; antifungal; antifungal; antishematory; antibacterial; cradialization; and proteins in genetial pathological conditions associated with an CC proteins in gene therapy vectors. The proteins and nucleic acids may be CC disorders, osteoarthrifis, graft vs host disease, neurodegenerative condisorders, systemic lupus erythematosus, severe combined immunodeficiency considers, systemic lupus erythematosus, severe combined immunodeficiency contiders, sathma, allergies, aplastic anaemia, burns, wounds, bone and contraceptive.

Zneul is a new Euro-growth factor-like protein that can be used as a growth, and intenance, or differentiation factor in the spinal cord, heart, cord in breast cancer, glioblastomas, and pitutary adenomas. Zneul may also play a cord can be used to treat Alzheimer's disease, cancer, to made in the placenta, in fertility and contraception, or to including specific domains of Zneul and epitope bearing portions of components and energy. Claimed Zneul and epitope bearing portions of components assessed to raise specific antibodies for use e.g. in

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This claimed polypeptide comprises amino acid residues 105-273 of CC the human Zneul mature protein (see W88382), i.e. the 2 epidermal CC growth factor-like domains (see also W88384), i.e. the 2 epidermal CC growth factor-like domain of Zneul Zneul is a new neuro-growth CC factor-like protein that can be used as a growth, maintenance, or CC differentiation factor in the spinal cord, heart, spleen, testis, CC thyroid and lymph nodes. Zneul may also play a role in breast CC cancer, gliobiastomas, and pituitary adenomas. Zneul can be used to treat Alzheimer's disease, cancer, to repopulate blood cells after chemotherapy, to stimulate myofibroblast proliferation, CC fertility and contraception, or to regenerate nerves. Claimed CC Incul polypeptides (see also W88382-97), including specific domains CC facul and epitope-bearing portions of Zneul, can be used to raise specific antibodies for use e.g. in diagnostic assays.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Qγ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               CC This invention describes novel cDNA sequences (A) highly expressed in cormal uterine tissue which can have anticancer and cytostatic activity cand can be used for gene therapy. (A) are used (i) for recombinant complete genes. (C) and can be used for gene therapy. (A) are used (i) for recombinant complete genes. (C) the are used (i) to identify agents suitable for treatment of uterine cancer; (ii) directly for treating this form of cancer (including compession from gene therapy vectors) and (iii) for generation of compectific antibodies. (A) are identified by assembling ESTS (expressed sequence tags) from a particular tissue type before comparison of compenses of the particular tissue type before comparison of the gene to be revealed, so should reduce the number of failures associated with the fact that ESTS from different libraries may represent compenses of the same unknown gene, distorting the estimated componency of occurrence in a particular tissue. Y5988-Y5982 represent compenses of fragments represented in Z41325-Z41385.
Y52138-Y52140 are amino acid sequences of spliced variants of TANGO 125 (T125). The T125 protein (Y52137) has two epidermal growth factor (EGF)-like domains at amino acids 107-134 and 141-176 and is predicted to have a molecular weight of approximately 30kD. T125 is predicted to have no transmembrane domains and appears to be a secreted protein. The sequences of all variants of T125 are used in the invention to create antibodies which selectively bind to T125. The T125 polypeptide is used
                                                                                                                                                             Novel polynucleotides and cellular processes -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            to modulate a variety of cellular processes. It can be used to produce fusion proteins. The protein may also be used to produce antibodies, and identify T125 antagonists and agonists. The T125 polynuclectides, predictive medicine; and methods of treatment of T125 associated disorders. The T125 polynuclectides can be used in screening assays; to detect T125 mRNA; to detect genetic alterations in the T125 gene; in forensic biology; and as a source of primers and probes.

In its EGF-like domains and may CC adult tissues, with high expression in heart, placenta, spleen, cc a growth, maintenance, or differentiation factor in the spinal cord and lymph node. Zneul can be used as CC cord, heart, spleen, testis, thyroid and lymph nodes. It may CC cord, heart, spleen, testis, thyroid and lymph nodes. It may CC cord, heart, spleen, testis, thyroid and lymph nodes. It may CC cord, heart, spleen, testis, thyroid and lymph nodes. It may CC cord, heart, spleen, testis, thyroid and lymph nodes. It may CC cancer, to repopulate blood cells after chemotherapy, to stimulate CC myofibroblast proliferation, stimulate or inhibit growth factors and ein the placenta, in fertility and contraception, or to including specific domains of Zneul polypeptides (see also W88382-97), Z Zneul, can be used to raise specific antibodies for use e.g. in

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                CC C74446 to C77606 encode the proteins given in B40237 to B43397, which CC represent the human ORFX open reading frames 1 to 3161. The ORFX CC sequences have activities such as: cytostatic; hepatotropic; vulnerary; CC antipsoriatic; antiparkinsonian; mootropic; neuroprotective; osteopathic; CC anticonvulsant; antiparkinsonian; mootropic; neuroprotective; osteopathic; CC antiant; thrombolytic; coaquiant; vasotropic; antibacterial; CC antiviral; antifungal; antirheumatic; antiinflammatory; antibacterial; CC antiviral; antifungal; antirheumatic; antihtyroid; and antianaemic. The CC equences can be used for determining the presence of or predisposition CC to, or preventing or treating pathological conditions associated with an CC ORFX-associated disorder. The nucleic acids can be used to express ORFX CC proteins in gene therapy vectors. The proteins and nucleic acids may be CC used to treat cancers, proliferative disorders, neurodegenerative CC disorders, osteoarthritis, graft vs host disease, cardiovascular disease, CC disperses mellitus, hypertension, hypothyroidism, cholesterol ester CC storage, systemic lupus erythematosus, severe combined immunodeficiency CC (SCID), AIDS, viral, bacterial or fungal infection, malaria, autoimmune CC disorders, asthma, allergies, aplastic anaemia, burns, wounds, bone and CC cartilage damage, nocturnal haemoglobinuria, antiinflammatory disease; to enhance coagulation; to inhibit thrombosis; and as a contraceptive.
                                                                                                                                                                                                                                                                                                                                                                                  RESULT 12
                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match

                                                                                                                                                                                                                                                                                                                                                                       Y41770 standard; Protein; 273
                                                                                                                                                                                                                                                                                                                                                          Y41770;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention describes secreted and transmembrane polypeptides and their polynucleotides. The nucleotide sequences are useful as sources of probes, primers, for chromosome mapping, and for generation of antisense sequences. They can also be used to create transgenic disorders, depending on their function. Diseases that may be treated include blood coagulation disorders, cancers and cellular adhesion disorders. They may also be used to raise antibodies. 23438, and y41685 to y41774 represent polynucleotide and polypeptide sequence given in the exemplification of the present invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention describes secreted and transmembrane polypeptides and their polynucleotides. The nucleotide sequences are useful as sources of probes, primers, for chromosome mapping, and for generation of antisense sequences. They can also be used to create transgenic animals. The proteins can be used to treat a variety of diseases and disorders, depending on their function. Diseases that may be treated include blood coagulation disorders and cellular adhesion disorders. They may also be used to raise antibodies. 233891 to 234338, and Y41685 to Y41774 represent polynucleotide and polypeptide sequence given in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     1 GGGCVQPG 8

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention describes secreted and transmembrane polypeptides and their polypucleotides. The nucleotide sequences are useful as sources of probes, primers, for chromosome mapping, and for generation of antisense sequences. They can also be used to create transgenic disorders, depending on their function. Diseases that may be treated include blood coagulation disorders, cancers and cellular adhesion 234338, and y41685 to y4174 represent polynucleotides. 23391 to sequence given in the exemplification of the present invention.

CC like protein. Its amino acid sequence was deduced from the contained protein. Its amino acid sequence was deduced from the contained protein. Its amino acid sequence was deduced from the contained protein contained from a comparison of a cDNA clone isolated from a comparison contained in the HLA class III region, which is contained in a cosmid comparison of the contains when a comparison of the contains when a cosmid comparison contains and may be involved in EGF receptor pathways. The comparison is contained in a cosmid comparison of the contains and may be involved in EGF receptor pathways. The placenta, spleen, testis, thyroid, splinal cord and lymph comparison in contained in the splinal cord, heart, spleen, testis, concer, comparison in comparison of contained and lymph nodes. It may also play a role in breast cancer, comparison comparison of contained and pituitary adenomas. Theul may be used to treat comparison of contained containe

    Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Score

The isolation and the amino acid sequence of protein SCMKB-M2.6.";

S. Afr. Chem. Inst. 28:250-263(1975),

-I- FUNCTION: THE KERATIN PRODUCTS OF MAMMALIAN EPIDERWAL DERIVATIVES SUCH AS WOOL AND HAIR CONSIST OF MICROFIBRILS EMBEDDED IN A RIGID MATRIX OF OTHER PROTEINS. THE MATRIX PROTEINS INCLUDE THE HIGH-SULFUR AND HIGH-TYROSINE KERATINS, HAVING MOLECULAR WEIGHTS OF 6-20 KDA, WHEREAS THE MICROFIBRILS CONTAIN THE LARGER, LOW-SULFUR AS 2978; KRGT3J.
